Advanced Installation

This page will walk you through various types of installation

Table of Contents

- [Node.js](#)
- [Browser](#)

Node.js

GramJS works out of the box in node and can be installed from npm:

```
$ npm i telegram
```

The package name is telegram not gramjs.

You can also install it from github where you will find the latest changes (possibly not stable):

```
$ git clone https://github.com/gram-js/gram-js
$ cd
```

Browser

GramJS uses webpack to provide a browser file if needed. You can also import it into your project and it will compile fine.

To get a JS file first clone the repo and install all dev dependencies then simply use

```
$ webpack
```

you will find the bundle file in the [browser](#) folder.

Currently, bundle files aren't provided separately and need to be compiled. GramJS has a [telegram group](#) where you can ask for a file if building is out of the option for you.
